Description

TECHNICAL FIELD

[0001] The present invention relates to indole derivatives.

[0002] More specifically, the present invention relates to indole derivatives represented by formula (I):

wherein all symbols have the same meanings as described below), the non-toxic salts,
(2) productin methods, and
(3) medicines comprising them as an active ingredient.

BACKGROUND ART

[0003] Prostaglandin D₂ (hereinafter referred to as "PGD₂") are known as a metabolite in the arachidonic acid cascade, and are thought to be one of chemical transmitters that take part in allergic disease, for example, allergic rhinitis, bronchial asthma, and conjunctivitis allergic. It has been known that PGD₂ is produced from mast cells and free PGD₂ shows bronchoconstriction, permeability accentuation, vasodilation or shrinkage, mucus secretion promotion, and platelet aggregation inhibitory effect. It has been reported that PGD₂ induces airway contraction and rhinostenosis symptom in vivo and the increase in PGD₂ concentration has been recognized in the pathologic topical of systemic mast cytosis (mastocytosis) patients, nasal allergy patients, bronchial asthma patients, atopic dermatitis patients, and urticaria patients, etc. (*New Eng. J. Med.*, 303, 1400-1404 (1980), *Am. Rev. Respir. Dis.*, 128, 597-602 (1983), *J. Allergy Clin. Immunol.*, 88, 33-42 (1991), *Arch Otolaryngol Head Neck Surg*, 113, 179-83 (1987), *J. Allergy Clin. Immunol.*, 82, 869-77 (1988), *J. Immunol.*, 146, 671-6 (1991), *J. Allergy Clin. Immunol.*, 83, 905-12 (1989), *N. Engl. J. Med.*, 315, 800-4 (1986), *Am. Rev. Respir. Dis.*, 142, 126-32 (1990), *J. Allergy Clin. Immunol.*, 87, 540-8 (1991), *J. Allergy Clin. Immunol.*, 78, 458-61 (1986)). Also, PGD is considered to relate to neuro activities, especially, sleep, hormone secretion, and pain. Furthermore, there are reports suggesting participations in platelet aggregation, glycogen metabolism, ocular tension adjustment and the like.

[0004] PGD₂ shows its effects by binding to DP receptor which is one of receptor thereof. A DP receptor antagonist binds and is antagonistic to its receptor so that it can inhibit the function. Accordingly, it is considered to be useful for the prevention and/or treatment of diseases, for example, allergic diseases (allergic rhinitis, allergic conjunctivitis, atopic dermatitis, bronchial asthma, food allergy, etc.), systemic mastocytosis, disorders due to systemic mastocyte activation, anaphylactic shock, bronchoconstriction, urticaria, eczema, psoriasis, allergic bronchopulmonary aspergillosis, paranasal sinusitis, migraine, nasal polyp, hypersensitive angitis, eosinophilia, contact dermatitis, diseases accompanied with itching (such as atopic dermatitis, urticaria, allergic conjunctivitis, allergic rhinitis, contact dermatitis, etc.), secondary diseases (such as cataracta, retinodialis, inflammation, infection, dysgryphia, etc.) generated by behaviors caused by itching (scratching behaviors, beating, etc.), inflammation, chronic obstructive pulmonary disease, ischemic reperfusion disorder, cerebrovascular disorder, brain damage, hepatopathy, graft rejection, autoimmune disease, rheumatoid arthritis, pleuritis complicated by rheumatoid arthritis, osteoarthritis, crohn's disease, ulcerative colitis, pain and the like. Moreover, it is considered to relate to sleeping and platelet aggregation and to be useful for these diseases.

[0005] It is known that PGD₂ binds with chemoattractant receptor-homologous molecule expressed on Th2 cells (CRTH2 besides DP receptor, and has the migration action on Th 2 cell, eosinophil, and basophil (*J. Exp. Med.*, 193, 255-261 (2001), *Blood*, 98, 1942-1948 (2001)). Since PGD₂ is a ligand to both of DP and CRTH2 receptors in Th2

cells, eosinophils, and basophils in vivo, DP receptor antagonists are expected to bind with CRTH2 receptor, and to antagonize the biological activity.

[0006] So, it is considered to be useful for the prevention and/or treatment of diseases, allergic diseases, for example, allergic rhinitis, allergic conjunctivitis, atopic dermatitis, bronchial asthma, food allergy, *etc.*, systemic mastocytosis, disorders due to systemic mastocyte activation, anaphylactic shock, bronchoconstriction, urticaria, eczema, allergic bronchopulmonary aspergillosis, paranasal sinusitis, migraine, nasal polyp, hypersensitive angitis, eosinophilia, contact dermatitis, diseases accompanied with itching such as atopic dermatitis, urticaria, allergic conjunctivitis, allergic rhinitis, contact dermatitis, *etc.*; secondary diseases such as cataracta, retinodialysis, inflammation, infection, dysgryphia, *etc.* generated by behaviors caused by itching (scratching behaviors, beating, *etc.*), inflammation, chronic obstructive pulmonary disease, ischemic reperfusion disorder, cerebrovascular disorder, pleuritis complicated by rheumatoid arthritis, ulcerative colitis and the like.

[0007] Some PGD₂ receptor antagonists are known conventionally, and BW-A868C represented by the following formula (A) is considered to be the most selective:

[0008] Recently, PGD₂ receptor antagonists comprising thromboxane derivatives have been published in WO 98/25915, WO 98/25919, WO 97/00853, WO 98/15502 and the like.

DISCLOSURE OF THE INVENTION

[0009] As prostaglandin receptors, a lot of receptor including the subtype exist and the pharmacological action is respectively different. Then, if a new compound that weakly binds to other prostaglandin receptors and specifically binds to PGD₂ receptor, especially DP receptor can be found, there is a possibility to become a medicine having a little side effect because of disappear of other actions, and discovery of such a medicine is necessary.

[0010] The present inventors intensively studied to find a compound which specifically binds to PGD₂ receptor, especially DP receptor and show an antagonistic activity and found that the object could be attained by indole derivatives represented by formula (I), and thus the present invention has been completed.

[0054] PGD₂ receptor in this specification represents receptors that PGD₂ binds, not only the one found by present, but also the one that will be found in the future is included in the receptor. The desirable one is DP receptor or CRTH2 receptor, and more desirably DP receptor.

[Salts]

[0055] All non-toxic salts are included in the present invention.

[0056] The compounds represented by formula (I) in the present invention may be converted into the non-toxic salts by a well-known method. The non-toxic salts are suitable to be allowed in pharmacology, and water-soluble.

Pharmacological Activities:

[0091] The compound of the present invention represented by formula (I) potently binds to a DP receptor and shows an antagonistic activity. This effect was confirmed by the following receptor binding test using prostanoid receptor-expressing cells.

(i) Receptor binding test using prostanoid DP receptor-expressing, cells

[0092] CHO cells expressing mouse DP receptors were prepared according to the method of Hirata *et al.* (*Proc. Natl Acad Sci.*, 91, 11192-11196 (1994)) and used as a membrane standard.

[0093] A reaction solution (200 μL) containing the prepared membrane standard (30-166 μg) and ^3H -PGD₂ was incubated at room temperature for 20 minutes. The reaction was stopped with an ice-cold buffer (1 mL) and the

binding $^3\text{H-PGD}_2$ was trapped in on a glass filter by immediate aspiration-filtration under a reduced pressure, and its binding radioactivity was measured using a liquid scintillation counter.

[0094] Kd value and Bmax value were obtained from Scatchard plots (*Ann. N. Y. Acad. Sci.*, 51, 660 (1949)). Non-specific binding was obtained as the binding radioactivity in the presence of unlabeled PGD_2 at an excess amount (10 $\mu\text{mol/L}$). $^3\text{H-PGD}_2$ binding inhibition by the compound of the present invention was measured by adding $^3\text{H-PGD}_2$ (2.5 nmoL) and the compound of the present invention as various concentrations. Also, the following buffers were used for the reactions.

Incubation buffer:

HEPES-NaOH (25 mmol/L, pH 7.4)
EDTA (1 mmol/L)
 MgCl_2 (5 mmol/L)
 MnCl_2 (10 mmol/L)

Buffer for washing:

Tris-HCl (10 mmol/L, pH 7.5)
NaCl (0.1 mol/L)
Bovine serum albumin (0.01%)

[0095] The dissociation constant (K_i) ($\mu\text{mol/L}$) of each compound was obtained by the following equation.

$$K_i = \text{IC}_{50} / (1 + ([L]^* / K_d))$$

[L*]: Concentration of radioligand

[0096] The result is shown in table 55.

Table 65

Example Num	DP K_i (μM)
2 (16)	0.031

[0097] As shown in the above results, it is apparent that the compound of the present invention potently binds to DP receptor.

(ii) DP antagonistic activity assay using prostanoid DP receptor-expressing cells may be examined by the following method.

[0098] CHO cells expressing mouse DP receptor were prepared, inoculated onto a 24-well microplate at 10^5 cells/well, followed by culturing for 2 days, and used for the assay. Each well was washed with 500 μL of MEM (minimum essential medium), and 450 μL of assay medium (MEM containing 1 mmol/L IBMX, 2 $\mu\text{mol/L}$ diclofenac and 0.1 or 1% BSA), followed by incubation at 37°C for 10 minutes. Then, an assay medium (50 μL) containing PGD_2 alone or PGD_2 with a compound of the present invention was added thereto to start the reaction, and after the reaction at 37°C for 10 minutes, 500 μL of ice-cold trichloroacetic acid (TCA) (10% w/v) was added thereto to stop the reaction. The reaction solution was frozen once (-80 °C) and thawed, and cells were peeled using a scraper, followed by centrifugation at 13,000 rpm for 3 minutes. The cAMP concentration was measured with a cAMP assay kit using the resulting supernatant. That is, [^{125}I]-cAMP assay kit buffer was added to 125 μL of the supernatant to give a total amount of 500 μL , and the resulting mixture was mixed with 1 mL of a chloroform solution of 0.5 mol/L tri-n-octylamine. Trichloroacetic acid (TCA) was extracted to the chloroform layer and removed, the cAMP amount in a sample was determined using the aqueous layer as the sample according to the method described in the [^{125}I]-cAMP assay kit.

[0099] Also, with regard to the antagonistic activity (IC_{50}) of the test compound, the IC_{50} value was calculated as an inhibition rate based on the reaction at 100 nM which was a concentration showing submaximal cAMP production by PGD_2 alone.

[0122] Mass ratio of the compound represented by formula (I) to other medicine is not especially limited.

[0123] Other medicines may be administered combining with two arbitrary kinds or more.

50 [0124] In other medicines that supplement and/or reinforce prophylactic and/or therapeutic effects of the compounds represented by formula (I), not only one that has been found by present according on the above mechanism but also one that will be found in the future are included.

[0125] To use the compound represented by formula (I) or non-toxic -salt thereof, or a combin drug containing the compound represented by formula (I) and other medicines by the above purpose, it is usually administered systemically or locally, and orally or parenterally.

55 [0126] The dosage is determined depending on age, body weight, symptom, therapeutic effect, administration route, duration of the treatment and the like. Generally, 1mg to 1000mg per adult is orally administered once to several times per day, or 1mg to 100mg per adult is parenterally administered (preferably, nose drop, ophthalmic solution, ointment) once to several times per day, or intravenously administered for 1 to 24 hours per day, continuously.

[0127] Since the dose changes depending on various conditions as described above, there are cases in which doses

lower than or greater than the above ranges may be used.

[0128] When the compound represented by the formula (I) or the combined drug containing it and other medicines are administered, they are used as solid medicines, liquid medicines, and other compositions for internal use, and injections, external preparations, and suppositories, etc. for parenteral administration.

[0129] The solid compositions for oral administration include compressed tablets, pills, capsules, dispersing powders, granules, etc.

The tablets or pills may, if desired, be coated with film of gastric or enteric coating agents such as sugar, gelatin, hydroxypropyl cellulose or hydroxypropyl cellulose phthalate, or be coated with two or more films. Furthermore, capsules of absorbable materials such as gelatin are included.

[0132] The liquid compositions for oral administration include pharmaceutically acceptable emulsions, solutions, syrups and elixirs. For example, the ophthalmic solutions are made with tonicity agents (sodium chloride and concentrated glycerin, etc.), buffers (sodium phosphate and sodium acetate, etc.), surfactants (polysorbate 80 (trade name), polyoxyl 40 stearate, and polyoxyethylene hydrogenated castor oil, etc.), stabilizers (sodium citrate and disodium edetate, etc.), and preservatives (benzalkonium chloride and paraben, etc.), etc., which are properly selected optionally. These are sterilized in the final process or manufactured by the aseptic manipulation.

[0137] Inhalants for parenteral administration may include aerosol agents, inhalant powders or inhalant liquids, which may be used by being dissolved or suspended in water or other suitable media before using.

[0138] The inhalants are manufactured according to a well-known method.
